Jamaica Rose T. Fabon

MAY 2026

Introduction

Background of the Study

Technology plays an important role in improving business operations, especially in the food and restaurant industry. Many restaurants are now adopting computerized systems to improve customer service, increase operational efficiency, and reduce manual work. However, some establishments still rely on traditional manual processes in taking customer orders, recording sales, and monitoring daily operations.

BeeHive Restobar currently uses manual methods for handling customer transactions and monitoring business activities. This process may lead to several problems such as delayed service, incorrect order entries, lost records, inaccurate sales monitoring, and difficulty in managing customer requests efficiently. Manual recording also makes it difficult for the management to generate reports and monitor real-time business performance.

To address these challenges, the BeeHive Restobar Monitoring and Ordering System, a web-based application is designed to automate the ordering and monitoring process of the establishment. The system allows customers to browse the digital menu and place orders electronically while enabling administrators and staff to manage operations efficiently through a centralized monitoring system.

This system aims to improve service quality, reduce operational errors, and provide real-time monitoring of sales and customer orders.

Purpose of the System

The primary purpose of the system is to provide a digital platform that simplifies and automates the ordering and monitoring operations of BeeHive Restobar. The system is designed to improve customer experience by allowing faster and more accurate ordering while helping administrators and staff manage transactions and business activities effectively.

Specifically, the system aims to:

- Automate customer ordering processes
- Improve order accuracy
- Monitor sales and operations in real time
- Reduce manual workloads
- Improve overall operational efficiency

Importance of the Project

The project is important because it helps modernize restaurant operations by reducing manual work and improving service quality. It enhances order accuracy, speeds up transaction processing, and provides reliable sales monitoring for management.

Problems the System Aims to Solve

The BeeHive Restobar Monitoring and Ordering System aims to solve the following problems:

- **Delayed Order Processing**
 - Manual order taking can consume time, especially during peak business hours.
This may result in slower service and customer dissatisfaction.
- **Incorrect Order Entries**
 - Human errors during manual recording may cause incorrect orders, missing items, or inaccurate billing.

- **Difficulty in Sales Monitoring**
 - Manual sales recording makes it difficult for administrators to monitor daily sales and generate reports accurately.
- **Inefficient Business Operations**
 - Manual processes require more effort and time in handling transactions and monitoring activities.
- **Lack of Real-Time Monitoring**
 - Management cannot easily monitor current operations, active orders, and business performance in real time using traditional methods.

Objectives of the System

General Objective

To develop a web-based monitoring and ordering system for BeeHive Restobar that improves customer service, operational efficiency, sales monitoring, and order management.

Specific Objectives

The study specifically aims to:

1. Develop a digital menu system that allows customers to browse available foods online.
2. Create ordering feature that enables customers to place orders electronically.
3. Provide administrators with a monitoring dashboard for tracking orders and sales in real time.
4. Reduce manual errors in order taking and transaction recording.
5. Improve customer satisfaction through faster and more organized service.
6. Implement menu management features for updating food items, prices, and availability.
7. Integrate cash and online payment methods into the system.
8. Generate accurate sales monitoring and reporting.

Scope and Limitations

Scope of the System

The BeeHive Restobar Monitoring and Ordering System is designed to automate ordering and monitoring processes within the establishment.

The system includes the following features:

- Digital Menu Viewing
- Online Order Placement
- Order Monitoring Dashboard
- Daily Sales Monitoring
- Menu Management
- Store Status Management
- Payment Integration

Limitations of the System

Despite the capabilities of the system, several limitations exist:

- No Delivery Tracking Feature
- Web-Based Only
- No Third-Party Accounting Integration
- Limited Internet Dependency
- Limited User Roles

System Description

Overview of the System

The BeeHive Restobar Online Monitoring and Ordering System is a centralized web-based application designed to streamline customer ordering and business monitoring processes.

The system allows customers to interact with a digital menu and place orders electronically. Orders are automatically transmitted to staff and administrators for processing. The system also records transaction details and provides sales monitoring tools for management.

The system improves operational efficiency by reducing manual tasks and automating order processing.

Major Modules and Features

1. Customer Ordering Module

- This module allows customers to browse the digital menu, select food, place orders electronically, and monitor the status of their orders in real time.

2. Order Management Module

- This module enables staff to manage customer orders efficiently by viewing, updating, and processing active and completed orders.

3. Menu Management Module

- This module allows administrators to add, edit, update, and remove menu items, including prices, descriptions, and item availability.

4. Payment Management Module

- This module records customer payments, supports cash and online payment methods, and monitors transaction history and payment records.

5. Sales Monitoring Module

- This module provides real-time monitoring of daily sales, completed transactions, and business performance to help administrators generate accurate reports.

7. Dashboard and Reports Module

- This module provides summaries, analytics, and reports related to customer orders, sales transactions, menu performance, and daily operations.

User Roles and Functionalities

Customer

- View menu items
- Select food and beverages
- Place orders online
- Monitor order status
- Choose payment methods

Admin

- Manage menu items
- Monitor customer orders
- View sales reports
- Monitor Sale operations

Staff

- View active orders
- Update order status
- Process customer requests
- Coordinate order preparation

Technologies Used

Programming Languages

- **PHP**

Used as the server-side scripting language for handling system functions and database transactions.

- **JavaScript**

Used to create interactive system functions and improve user experience.

- **HTML**

Used to structure web pages and system interfaces.

- **CSS**

Used to design and improve the appearance of the system.

Frameworks and Libraries

- **Bootstrap** – Used for responsive and user-friendly interface design.
- **Express.js** - Used for Node.js backend development.
- **Laravel** - Used for application framework support.

Database Management System

MySQL

Used for storing customer records, orders, sales data, and menu information.

Development Tools

Visual Studio Code

Used as the primary code editor during system development.

XAMPP

Used as the local server environment for testing the system.

phpMyAdmin

Used for database management and monitoring.

Track Order

- Customers can track order status (Pending, Preparing, Ready, and Completed) using order number instead of customers name for privacy/Confidentiality.

The screenshot shows the 'Track Order' page of the BeeHive Restobar System. At the top, there's a navigation bar with 'Order', 'Track Order', and 'Staff / Admin' tabs. The main heading is 'Track Order'. Below it, there's an input field containing the order number 'BEE-260529-5AFE59' and a 'Track' button. The order status is displayed as 'PENDING' in a yellow box. Below the status, there are four buttons representing the order stages: 'Pending' (active), 'Preparing', 'Ready!', and 'Completed'. To the left, under 'Order details', it lists: 'Type: dine in', 'Table: Table 2', and 'Total: ₱114.00'. To the right, under 'Items', it lists: 'Footlong Classic x1' and 'Blueberry Soda x1'. At the bottom, it says 'BeeHive Restobar Laravel-only Order & Monitoring System'.

Beehive Portal

- Authorized person such as Admin and staff portal for logging in.

The screenshot shows the 'BeeHive Portal' login page. At the top, there's a navigation bar with 'Order', 'Track Order', and 'Staff / Admin' tabs. The main heading is 'BeeHive Portal'. Below it, there's a message: 'Select the access area. Default codes are staff123 and admin123.' There are two buttons: 'Staff Terminal' (yellow) and 'Management Dashboard' (dark blue). At the bottom, it says 'BeeHive Restobar Laravel-only Order & Monitoring System'.

Staff Login Area

The screenshot shows the 'Staff Login' page. At the top, there's a navigation bar with 'Order', 'Track Order', and 'Staff / Admin' tabs. The main heading is 'Staff Login'. Below it, there's a 'Staff PIN' label and an input field with the placeholder text 'Enter PIN'. There's a dark blue button labeled 'Enter Portal'. Below the button, it says 'Default staff PIN: staff123'. At the bottom, it says 'BeeHive Restobar Laravel-only Order & Monitoring System'.

Staff BeeHive Kitchen Terminal

- Staff can view active orders, update order status, process customer requests and coordinate order preparation.

Start Preparation

- After Staff update order status, it will automatically reflect to customers order status.

Database Structure

List of Tables

1. Users Table

Field Name	Data Type	Description
user_id	INT (PK, AI)	Unique identifier of the user
full_name	VARCHAR(100)	Full name of the user
username	VARCHAR(50)	Login username
password	VARCHAR(255)	Encrypted password
role	ENUM('Admin','Staff')	User access level
pin_code	VARCHAR(20)	Security PIN

2. Categories Table

Field Name	Data Type	Description
category_id	INT (PK, AI)	Unique category ID
category_name	VARCHAR(100)	Food category name
display_order	INT	Category display order
created_at	TIMESTAMP	Date category created

3. Menu_Items Table

Field Name	Data Type	Description
menu_id	INT (PK, AI)	Unique menu item ID
category_id	INT (FK)	Linked category
menu_name	VARCHAR(150)	Food or beverage name
description	TEXT	Item description
price	DECIMAL(10,2)	Selling price
image_path	VARCHAR(255)	Menu image location
availability	ENUM('Available','Unavailable')	Item availability
created_at	TIMESTAMP	Date added
updated_at	TIMESTAMP	Date modified

4. Dining_Tables Table

Field Name	Data Type	Description
table_id	INT (PK, AI)	Unique table ID
table_number	VARCHAR(20)	Table number
capacity	INT	Number of seats
status	ENUM('Available','Occupied','Reserved')	Table status
created_at	TIMESTAMP	Date created

5. Orders Table

Field Name	Data Type	Description
order_id	INT (PK, AI)	Unique order ID
order_number	VARCHAR(50)	Customer tracking number
customer_name	VARCHAR(100)	Optional customer name
order_type	ENUM('Dine-In','Take-Out')	Type of order
table_id	INT (FK, NULL)	Assigned table for dine-in
order_note	TEXT	Customer request/note
payment_method	ENUM('Cash','GCash')	Selected payment method
total_amount	DECIMAL(10,2)	Total order amount
order_status	ENUM('Pending','Preparing','Ready','Completed','Cancelled')	Current order status
created_at	TIMESTAMP	Order date/time
updated_at	TIMESTAMP	Last update date/time

6. Order_Details Table

Field Name	Data Type	Description
order_detail_id	INT (PK, AI)	Unique detail ID
order_id	INT (FK)	Related order
menu_id	INT (FK)	Ordered menu item
quantity	INT	Quantity ordered
unit_price	DECIMAL(10,2)	Price at time of order
subtotal	DECIMAL(10,2)	Quantity × Price

7. Payments Table

Field Name	Data Type	Description
payment_id	INT (PK, AI)	Unique payment ID
order_id	INT (FK)	Related order
payment_method	ENUM('Cash','GCash')	Payment type
amount_paid	DECIMAL(10,2)	Amount received
reference_no	VARCHAR(100)	GCash transaction reference
payment_status	ENUM('Pending','Paid','Failed')	Payment status
payment_date	DATETIME	Date of payment

8. Sales Table

Field Name	Data Type	Description
sale_id	INT (PK, AI)	Unique sale record
order_id	INT (FK)	Related completed order
total_sales	DECIMAL(10,2)	Total sale amount
payment_id	INT (FK)	Related payment
sale_date	DATETIME	Date of transaction
recorded_by	INT (FK)	Admin/Staff who processed

9. System_Settings Table

Field Name	Data Type	Description
setting_id	INT (PK, AI)	Unique settings record
business_name	VARCHAR(150)	Restobar business name
tagline	VARCHAR(255)	Business tagline
gcash_account_name	VARCHAR(100)	GCash account holder
gcash_number	VARCHAR(20)	GCash mobile number
qr_code_image	VARCHAR(255)	QR code image path
admin_pin	VARCHAR(50)	Admin security PIN
staff_pin	VARCHAR(50)	Staff security PIN
updated_at	TIMESTAMP	Last update

Relationships Between Tables

- One customer can create multiple orders.
- Orders are connected to payment records.
- Sales records are generated from completed transactions.
- Menu items are associated with customer orders.

Implementation and Testing

Development Process

The development of BeeHive System followed the Software Development Life Cycle (SDLC) process during development.

Planning

Identified system requirements and project objectives.

Analysis

Existing business problems and operational challenges were analyzed.

Design

System architecture, database structure, and interface designs were created.

Development

Coding and database implementation were performed.

Testing

System functions were tested for errors and performance issues.

Deployment

The final system was prepared for implementation.

Testing Procedures Performed

Functionality Testing

Ensured that all system features worked properly.

User Interface Testing

Checked the responsiveness and usability of the interface.

Database Testing

Verified database connections and data accuracy.

User Acceptance Testing

Allowed users to test the system and provide feedback.

Problems Encountered

- Database connection errors
- Incorrect order computations
- Interface responsiveness issues
- Delayed loading times

Solutions Applied

- Fixed database configuration settings
- Improved computation logic
- Optimized database queries
- Enhanced interface responsiveness

Conclusion

The BeeHive Restobar Online Monitoring and Ordering System successfully achieved its objectives by providing a web-based solution for restaurant ordering and business monitoring.

The system improved order processing efficiency minimized manual errors, and enhanced customer service through digital transactions and real-time monitoring. Administrators and staff were able to manage operations more effectively using the monitoring dashboard and sales tracking features.

The project also helped improve knowledge and skills in web development, database management, system analysis, and software testing. The successful completion of the project demonstrates the importance of technology in improving business operations and customer satisfaction.

Recommendations

For future enhancement of the system, the following recommendations are suggested:

Mobile Application Development

- Develop a mobile version of the system for easier customer access.

Delivery Tracking System

- Add delivery management and real-time tracking functionality.

Inventory Management

- Integrate inventory monitoring for automatic stock updates.

Advanced Analytics

- Provide advanced sales analytics and business reports.

Customer Feedback Feature

- Add customer review and feedback functionality.

Notification System

- Implement SMS or email notifications for order updates.
